

A

PROJECT

TITLE

**HOTEL
MANAGEMENT**

INTRODUCTION TO PROJECT

INTRODUCTION

DEFINITION

"HOTEL" OR "INN" is defined by **British** law as a "place where bonafide can receive food and shelter provided, he is in position to pay for it and is in a fit condition to the received". Hence a hotel must provide food and (beverage) and lodging to travelers on payment and his turn the right to refuse if the traveler is disorderly, unkempt, drunk or is not in position to pay for the services.

To develop a software system it is very essential to completely understand the working and all the different aspects of the current system. To analyze various problems of the system and various directives for the system we need through understanding of existing system in the present manual hotel that store the information for each is not an easy task and it is time consuming task too. So for simplicity of this task, automation of hotel is necessary.

Now a day's computer has been used in every field, either in organization, institutes or in shops. The need of computer is essential because it saves lots of time and money. Various organization uses different - different software according to their requirement. Software is a collection of different programs that are used to achieve a predefined goals or objective. In most cases a manual system that is in use has to be automated on the same lines so as to provide a more effective outcome. There are many benefits of using an automated system as compare to manual system. It is fast and thus time saving it is more accurate and also required much less effort.

Hotels which are having 25 or less room may be termed as 'small' hotels. Hotels which are having 25 to 100 rooms may be called 'large' hotels. And hotels with over 300 rooms with over 300 rooms which are common these days may be termed as 'very large' hotels.

- ✦ *Hotels are categorized according to the type of plan; we thus have hotels on European plan, American plan or continental plan for a Discussion of plants. These plans are decided by the hotel on a variety of factors including type of clientele, length of stay and customer average Preference.*
- ✦ *Hotels where a guest can stay for a day or even.*
- ✦ *Where guest stay for minimum period of one month.*
- ✦ *Semi-residential hotels.*

SOFTWARE DEVELOPMENT LIFE CYCLE

SOFTWARE **DEVELOPMENT LIFE** **CYCLE**

SDLC is a conceptual model use on project management that describes the stage involved in an information. SDLC methodology have been development to guide the process developed to involve including water fall model, rapid application development, joint application development, spiral model & prototyping model.

Basically the SDLC is a classical through of at the set of activities that analysis from a designer and user carry out develop and implement and information system.

The SDLC are seven phases:

- ☐ ***Recognition of the need***
- ☐ ***Feasibility study***
- ☐ ***Analysis***
- ☐ ***System design and detailed***
- ☐ ***Implementation & testing***
- ☐ ***Maintenance***

- **Recognition of the need:** *An analysis is first job is to prepare a statement a statement specification the scope & object of the system. The first module which needs to be taken into consideration is that of finding all the possible function that needs to be performing during the directory browsing. Number function available will make it more flexible and effective.*
- **Feasibility study:** *Feasibility study involves making a preliminary determination of the end user's need and determine the feasibility that system is going to satisfy goals of project or not. The goal of feasibility study is to evaluate system and to provide most feasible and desirable system for development.*
- **Analysis:** *Information is a very crucial commodity for end users. The information system ability to product useful information can be evaluated for problems and opportunity.*
- **System design and detail:** *The design phase is a vitally important phase. It starts only after the SRS document has been prepared. In the design phase, attempts are made to transform the s/w requirements into such a form that the programmer may be written easily. Design may be carried out in any traditional methodology or object oriented methodology.*
- **Implementation & testing:** *Testing is done removing all the bugs if any existing. During testing a system is used experimentally t o ensure that software does not fail.*

Implementation is the process of having system personal checkout & put new implement in to users, trend users, install the new application, constrict any file of data needed to use it. Depending on th size of organization that will be involved in using the application & the risk involved in it use.

- **Maintenance:** *When the s/w product is successful in the testing process and finally passes the acceptance testing, it is installed at customer's site. The most critical phase of its cycle then starts. This is known as maintenance of the s/w product. The maintenance of the product is done usually at customer's site. After installation, when the customers start using the product for their routine work, several problems are reported by the customers or their employees. The product is then modified. Sometimes is patch-up is sufficient and sometimes a new module is written.*

WATER FALL MODEL

The water fall model is a sequential software development model some times called the classic life cycle sequential model. Suggest a systematic, sequential approach to software development that beings at the system level and progress through analysis, design, coding and testing support. The water fall model has the following phases:

- ☐ ***Requirement analysis & specification***
- ☐ ***System design***
- ☐ ***Detailed design***
- ☐ ***Coding & unit testing***
- ☐ ***Integration & System testing***
- ☐ ***Implementation***
- ☐ ***Maintenance***

SYSTEM

ANALYSIS

SYSTEM ANALYSIS

1. Performance analysis:

Performance problem occur when business takes are performed too slowly to achieve the objectives. Performance opportunity occurs when some one recognizes away to spend up a business task that is otherwise achieving objectives. A performance directive may occur if management decides that all transaction is to be done on line to the computer to improve the performance. Performance is measured by throughput and response time is the average delay between a transaction and a response to that transaction. Although throughput and response time are taken separately that must also be considered together.

2. Information and data analysis:

Information is a very crucial commodity for end users. The information system ability to product useful information can be evaluated for problems and opportunity.

Improving overloading is a big problem for the businesses. But we get the correct and accurate information for the queries that are given to system we need to reduce the data redundancy and inflexibility.

3. Economic analysis:

Economic is perhaps the most common motivation for projects. Economic problems and opportunities pertain to cost. Thus we must analysis to that our projects.

4. Control and security analysis:

Control is the installed to improve the system performance. Prevent or

detect system and the business system. On the other hand a system with too many controls and check slow the throughput of the system.

5. Service analysis:

Service improvement involves a diverse category projects triggered by services improvement better service to the business improved service tend to increase the satisfaction.

FEASIBILITY

STUDY

FEASIBILITY STUDY

Feasibility is a measure of how beneficial the development of information system world to an organization. Feasibility study should be performing throughout the system development life cycle.

Feasibility study involves making a preliminary determination of the end user's need and determine the feasibility that system is going to satisfy goals of project or not. The goal of feasibility study is to evaluate system and to provide most feasible and desirable system for development.

Feasibility study should be performing at various level to see if it is as per a user requirement.

Different checkpoint can be placed at different levels to check the system these are after survey phase, after selection of the system and after design the system.

This feasibility can be divided into:

1. Operational feasibility:

The automation of Library System is easy to operate. So it can be concern that it is operationally feasible.

2. Economical feasibility:

How our system is economically feasible?

- ↪ Our system does not requires costly resources.
- ↪ It requires less time.
- ↪ Only one user can operate this system.

3. Technical feasibility:

- ↪ This system is required less hardware resources.

- ↳ It is very easy to install in the computer.
- ↳ This system required less space to be stored in memory.

Therefore we can say our system automation of Library System is technically feasible.

SOFTWARE

&

HARDWARE

REQUIREMENT

SOFTWARE & HARDWARE REQUIREMENT

- What is software?

The term software is used for describing all forms of programs associated with computer. Without software, a computer is like a car without engine.

Types of software:

- **System software**
- **Application software**

SOFTWARE REQUIREMENT

- *Operating System - Windows 7 , 8 or onwards.*
- *Application Software – MySQL Database Server(5.5.50) (Backend) and Java (1.7.0.0) for interface & program development (front end).*

HARDWARE REQUIREMENT

- *PENTIUM— IV Processor*
- *RAM— 1 GB*
- *HDD— 250 GB*
- *Color Monitor*
- *Mouse*
- *Keyboard*

SYSTEM

DESIGN

SYSTEM DESIGN

SYSTEM DESIGN is a actually multi steps process that focus after the purpose and specification of software is determine software developers will design or employee designers to developers a plan for a solution the goal of the space is to transform the requirement specification into a Structure.

That is suitable for converting it in same programming language. In these activities the functional specification are used for translating the Model into a design of desired system.

The design of information system produced the detailed that state how System will need the requirement identify during system analysis. In these phase basically we have to find out how should problem the solve.

The design phase is a vitally important phase. It starts only after the SRS document has been prepared. In the design phase, attempts are made to transform the s/w requirements into such a form that the Programmer may be written easily. Design may be carried out in any Traditional methodology or object oriented methodology. The traditional Design procedures include the following the following steps.

Traditional Software Design

- 1. Carry out structured analysis. The analysis yield the different functions or processes and a data flow among the process are Obtained. A pictorial representation (DFD) is used to use to represent The structured analysis.*
- 2. Obtain high level design. The data flow diagram is used to obtain high Level design. This design contains the information about the various*

Functions and how a particular function invokes the other functions.

3. Obtain detailed design. This design is obtained using high level Design. This fine design uses the algorithm and data structure.

Object Oriented Design

This is a new paradigm. Various objects in the system are identified. After the identified. After the identification of objects, the relationship Among them is also explored. Details of objects their internal data Methods are listed.

PROPOSED

DATABASE

PROPOSED DATABASE

A Data base is a collection of data organized for easy storage and access data is a single piece of information and can include, but is not limited to Text, image, number & media clip.

Data base management involves creating, modifying, deleting & Adding data in database and use this data to generate report. The software that allow us to perform these function are known as database Management system. Some popular database management system are:

MySQL

FOXPRO

ORACLE

MySQL

MySQL is an example of database management system. MySQL is a part of ORACLE suit like program, SQL allows filling system & support that facilitate record keeping.

The main features of MySQL are given below:

- 1. MySQL is a window command line application. In this program, you Can Cut, copy & paste data from any table to another table.*
- 2. We can create hundred keep columns in MySQL.*
- 3. It can also format data.*
- 4. It display user friendly validation text.*

5. *Data can be important from are exported to **FoxPro, excel, access & Other data formats.***

COMPONENTS OF MySQL WINDOW

- ☐ ***TMy Connection***
- ☐ ***TMy Query***
- ☐ ***TMy Command***
- ☐ ***TMy Table***
- ☐ ***TMy Update SQL***
- ☐ ***TMy Data Source***
- ☐ ***TMy Connect Dialog***
- ☐ ***T Virtual Table***

- ❑ *It is directly based upon the internal or external commands.*
- ❑ *It is based upon the query of sql syntax which perform an action in the database.*
- ❑ *It is used to to store the big data .Because it is plateform independent.*

Database serves as information base and you can use it for:

- ❑ ***Retrieving desired information.***
- ❑ ***Reorganizing information.***
- ❑ ***Taking meaningful decision.***

DATA

FLOW

DIAGRAM

DATA FLOW DIAGRAM

The DFD is also called bubble chart DFD represent a flow of data throughout the system. It is modeling tool which allow the analysis to represent the system with the help of diagram.

A data flow diagram is the graphical representation of the information flow and transformations that occurs when data flows form input to output.

The components of DFD:

- ❑ **Data flow:** *The data flow is used to describe the movement of information from one part of the system to the other part and this is denoted by either straight line or cure arrow.*
- ❑ **Data process:** *The process is the key component of DFD. The process is denoted by circle by which transform to input into the output.*
- ❑ **External entity:** *An entity is a real world object for which the data is store the data is store. The entity is represented by square or rectangle.*
- ❑ **Data store:** *This is used for collection of data and it is denoted by open ended rectangle.*

External entity

Process that transfers data flow

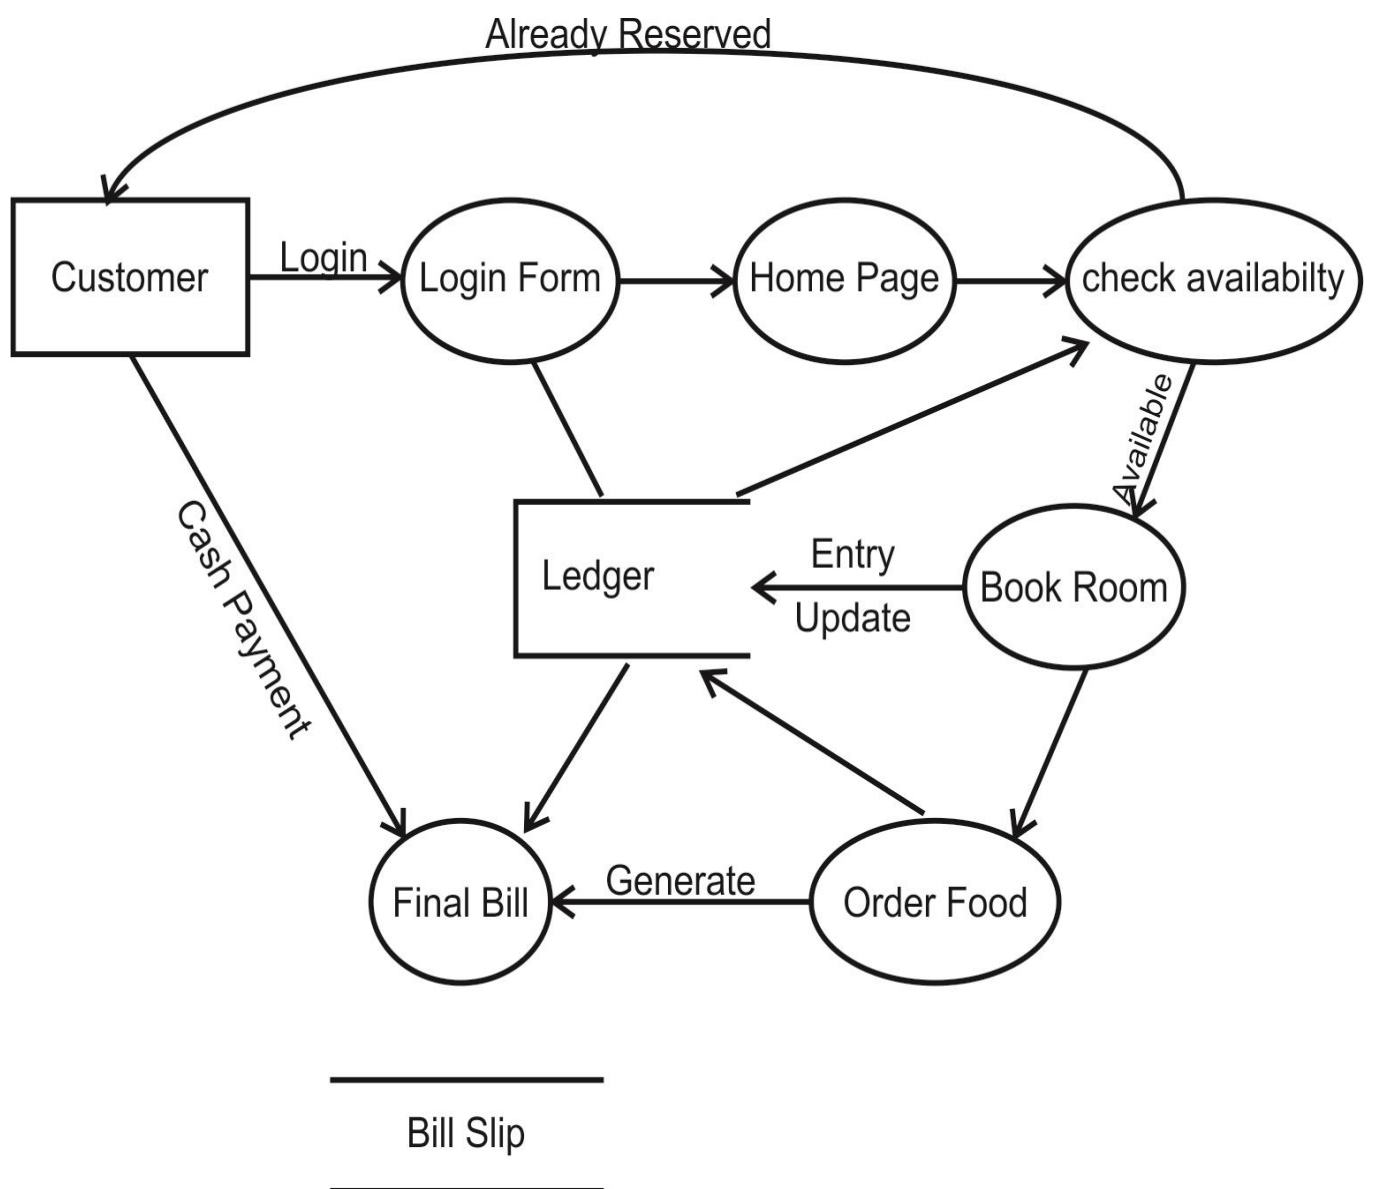

Data flow

Data store

0 LEVEL DIAGRAM

1 LEVEL DIAGRAM

ENTITY

RELATIONSHIP

DIAGRAM

ER-DIAGRAM

This is another tool of problem analysis. ER diagram provides a logical representation of data for organization. It uses three component:

Entity

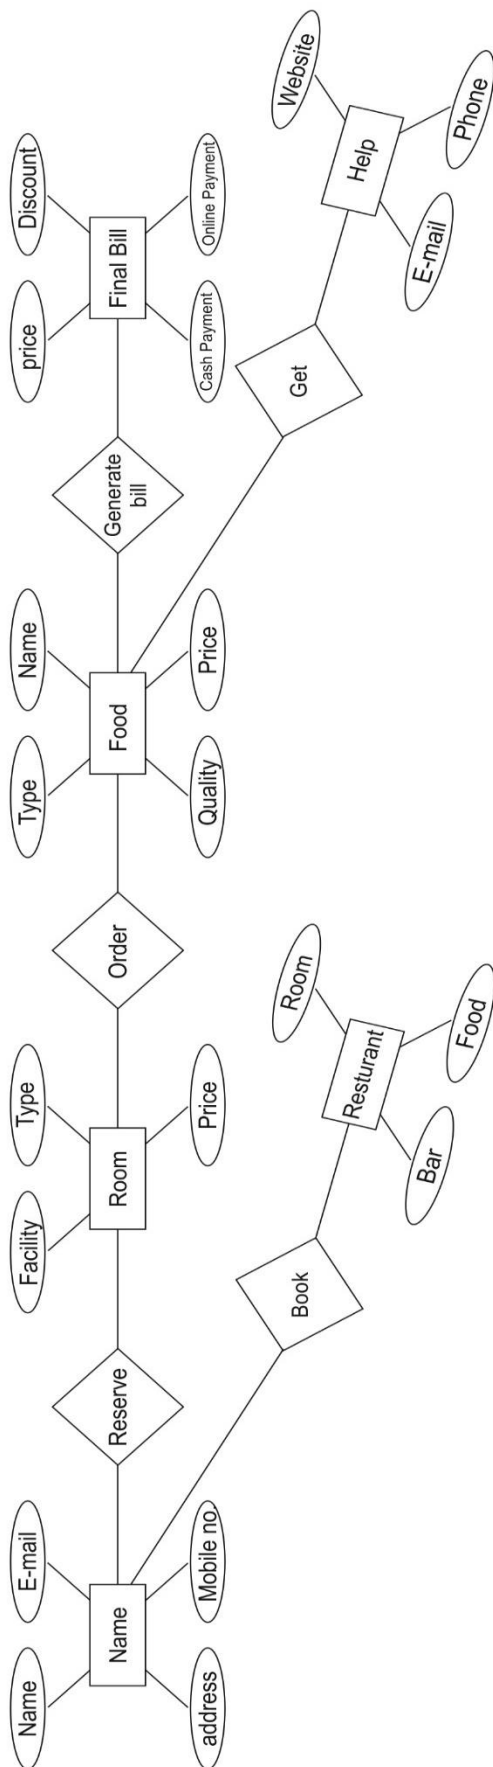

Relationship

Attributes

Entity: *An entity is a real world object for which data is collected and maintain and entity.*

Relationship: *Every entity related with the other entity any manner or we can say the relationship.*

Attributes: *An attributes is the property or characteristic for any entity.*

TESTING

TESTING

Testing is done by removing all the bugs if any existing. During testing a system is used experimentally to ensure that software does not fail.

In other word, we can say that it will run according to its specification & in the way the user expert specially test data are input before processing & the reult evaluates.

In this once the program are available test data are read into the computer and processed against the file provided for testing.

TYPES OF TESTING METHODOLOGY

Once the code for a module or function has been written, it is tested under several conditions. Testing of the code is done to observe whether it behaves asper the expectation. For testing a module or function, several test cases are generated and the behaviors of the program are observed. If the output at any test case is different than expected, then its code would have to be corrected or it has to be written. The exhaustive of a program is very difficult and might take lot of time. The test are so developed that they almost possible conditions. Testing of s/w may be categorized as follows:

1. Unit Testing
2. Integration Testing
3. System Testing

Unit Testing

The module or function code is first unit tested completion of code writing. In unit testing, a module is tested in isolation. Therefore, unit testing is also called isolation testing. The module is tested against several test conditions. There are two ways of code check called Code Walkthrough and Code Inspection. Code Walkthrough is an informal technique for analyzing quality of code. Here a team checks whether the programmer has followed the various rules and guideline of s/w Company in writing the code. Code inspection is formal process where the code for a module is checked in terms of the commonly made errors.

Integration Testing

After the unit testing of modules, the module developed undergoes integration testing. Various modules developed are integrated according to a certain plan and the cases are executed to check whether the various module works as a single entity. It is not necessary to put all modules together to perform integration testing.

System Testing

The final test is performed after developing all the modules according to the requirement. The objective of system testing is to determine whether the s/w system performs as per the requirements mentioned in SRS document. A fully develop s/w product is system tested. The system testing is done in three phases called Alpha, Beta and Acceptance Testing.

1. Unit testing is conducted by the s/w development team at the developer's site. The s/w products containing all the modules are intermarried and test cases executed. If all the product is successful, then the next phase Beta Testing is performed.

2. Beta Testing is performed by a group of friendly customers in the presence of the s/w development team. The problems noted and the suggestions made by the customer are considered. There are several cases where the customer is not one party; instead the s/w is developed for masses. For example OS like MS WINDOWS, DOS, UNIX, etc. the evaluation copy of such s/w is freely distributed among the target audience and feedback from the users are noted. The development team collects various views and suggestion of the selected user and modifies the code if necessary.

3. Acceptance Testing is performed by the customers themselves. If the s/w is successful in acceptance testing, the product is installed at the customer's site.

IMPLEMENTA -TION

IMPLEMENTATION

Implementation is the process of having system personal checkout & put new implement in to users, trend users, install the new application, construct any file of data needed to use it. Depending on the size of oragnisation that will be involved in using the application & the risk involved in it use.

Implementation is the process of having system personals & equipments the purpose of this phase is to turn the physical design specification into a properly working system, install it.

When the s/w product is successful in the testing process and finally passes the acceptance testing, it is installed at customer's site. The most critical phase of its cycle then starts. This is known as maintenance of the s/w product. The maintenance of the product is done usually at customer's site. After installation, when the customers start using the product for their routine work, several problems are reported by the customers or their employees. The product is then modified. Sometimes is patch-up is sufficient and sometimes a new module is written.

FUTURE

SCOPE

FUTURE SCOPE

The project can be used in the HOTEL after adding some more useful modules in the project for which HOTEL are providing services.

Almost care and backup procedures can be established to ensure 100% successful implementation of the computerized HOTEL system. In case of system failure. The organization should be in a position to process the transaction with another organization or if the worst, comes to the worst, it should in position to complete it manually.

Further Enhancement

1. A complete accounting system matching the VAT policy.
2. Web Module for web interface. After all the future is Internet.
3. Integrated on line examination module for entrance exams.

REFERENCE

BIBLIOGRAPHY

REFERENCE- BIBLIOGRAPHY

I have learn the theory part from book, but in reality practical is different. Thus at times needed help to revise what I had forgotten and for the help when I was stuck up.

The following books, reference material and websites helped me in getting details and sorting problems during this application development.

- **Java: The Complete Reference (Ninth Edition)**

By Herbert Schildt

- **Database Management System**

By Raghu Ramakrishnan

- **Software Engineering(Fifth Edition)**

By Roger S. Pressman, PH.D.
